## CHAPTER 2 SERVICE INFORMATION

### 2-1. REMOVAL

#### 2-1-1. Removing the Front Panel

. Remove the case (upper).

- ① Remove the six front panel setscrews.
- ② Remove connector CNP26 on the PU-35 board.
- ③ Pull out the front panel in the direction indicated by the arrow.

#### 2-1-2. Removing the EX-101 Board

. Remove the case (upper).

. Remove the front panel.

- ① Remove the four cartridge holder setscrews.
- ② Remove the two cartridge holders.
- ③ Remove the three connectors (CNP19, CNP13, and CNP11) on the PU-35 board.
- ④ Pull out the EX-101 board in the direction indicated by the arrow.

### 2-1-3. Removing the Floppy Disk Drive

. Remove the case (upper).

. Note: The front panel can be removed as shown in the figure below, but this is not necessary.

- ① Remove the two connectors at the rear of the drive unit.
- ② Remove the two drive unit setscrews.
- ③ Pull out the drive unit in the direction indicated by the arrow.

### 2-1-4. Removing the heat sink

. Remove the case (upper).

. Remove the bottom plate (loosen the nine setscrews).

- ① Remove the two setscrews (on the bottom plate) on the PS-101 board.
- ② Remove the two heat sink setscrews.
- ③ Pull out the heat sink in the direction indicated by the arrow, being careful not to drop the radiation sheet.

## 2-2. SERVICE PARTS

1. Safety Related Components Warning.  
Components identified by shading marked with  $\Delta$  on the schematic diagrams, exploded views and electrical spare parts list are critical to safe operation. Replace these components with Sony parts whose part numbers appear in this manual or in service bulletins and service manual supplements published by Sony.
2. Replacement Parts supplied from Sony Parts Center will sometimes have a different shape from the original parts. This is due to "accommodating the improved parts and/or engineering changes" or "standardization of genuine parts". This manual's exploded views and electrical spare parts list indicate the parts numbers of "the standardized genuine parts at present". Regarding engineering parts changes in our engineering department, refer to Sony service bulletins and service manual supplements.
3. Printed Components in Bold-Face type on the exploded views and electrical spare parts list are normally stocked for replacement purposes. The remaining parts are not normally required for routine service work. Orders for parts not shown in Bold-Face type will be processed, but allow for additional delivery time.
4. Abbreviations

Ref. No.	Description
C□□, CV□□	CAPACITOR
CN□□	CONNECTOR
CP□□	COMBINATION PARTS
D□□	DIODE
DL□□	DELAY LINE
F□□	FUSE
FL□□	FILTER
IC□□	IC
L□□, LV□□	INDUCTOR
M□□	MOTOR
ME□□	METER
PL□□	LAMP
Q□□	TRANSISTOR
R□□, RV□□	RESISTOR
RY□□	RELAY
S□□	SWITCH
T□□	TRANSFORMER
TH□□	THERMISTOR
X□□	CRYSTAL

5. Units for Capacitors, Inductors and Resistors  
The following units are assumed in schematic diagrams, electrical parts list and exploded views unless otherwise specified:

Capacitors:  $\mu$ F  
Inductors:  $\mu$ H  
Resistors: ohm

## CHAPTER 3 CIRCUIT DESCRIPTION

### 3-1. MEMORY MAP

The memory map viewed from the CPU is as shown below. Basic slot 0 of the memory map is extended to map RAMs and ROMs.

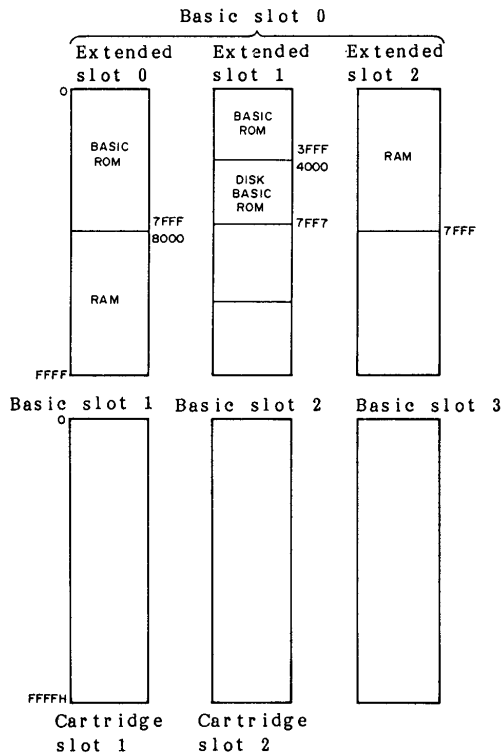

- ① Pages 0 and 1 (0000H through 7FFFH) of extended slot 0-0 are used to map the basic ROM of MSX2.
- ② Pages 2 and 3 (8000H through FFFFH) of extended slot 0-0 and pages 0 and 1 (0000H through 7FFFH) of extended slot 0-2 are used to map the main RAM.
- ③ Page 0 (0000H through 3FFFH) of extended slot 0-1 is used to map the extended MSX2 BASIC.
- ④ Page 1 (4000H through 7FF7H) of extended slot 0-1 is used to map the MSX2 disk BASIC.
- ⑤ The extended MSX2 BASIC and MSX2 disk BASIC are programmed in FC58 (32kB).

When the power switch is turned on, the power on reset is released, the MSX2 frame appears, and the MSX2 disk BASIC is loaded.

Turn on the power switch while pressing the **SHIFT** key, or press the RESET button while pressing the **SHIFT** key. The MSX BASIC of the ROM version then loads. Press the **SHIFT** key until the following message indicating the MSX BASIC of the ROM version appears on the frame.

MSX BASIC version 2.0

### 3-2. I/O PORT

Address buses A3 through A7 are fed to the address bus input terminal (pins 12 through 16) of IC18 (S-3527).

The address bus signal determines the I/O device being selected. The I/O devices are assigned as follows:

(PPI is incorporated into IC18 (S-3527)).

A7	A6	A5	A4	A3	I/O port address
1	0	0	1	0	PRINTER 90H, 91H
1	0	0	1	1	VDP 98H, 99H
1	0	1	0	0	PSG A0H~A2H
1	0	1	0	1	PPI A8H~ABH
1	0	1	1	0	TIMER B4H, B5H

The timer is selected by output  $\overline{Y6}$  of IC10. The timer, VDP, and the direction of data transferred on data bus ID0 through ID7 are specified by IC4-6 through IC10 and IC14.

### 3-3. S-3527 (MSX-SYSTEM)

S-3527 employs a Z80A (CPU) and is used to control peripheral devices. S-3527 has a built-in sound signal generator (SSG) and has the following 100 terminal pins at the edges of the package.

S-3527 pin assignment

#### 3-3-1. Terminal Pin Functions

- ① AB0, AB1, AB3 through AB7, AB14, and AB15 (Address buses)  
Bus lines to input the address signal to read/write data into the memory for an input/output operation.
- ② DB0 through DB7 (Data buses)  
Bus lines to read data into the memory or to output data from the I/O device.
- ③  $\overline{MREQ}$  and  $\overline{IORQ}$   
 $\overline{MREQ}$  is used to access the memory by using the signals from Z80A (CPU).  $\overline{IORQ}$  is used to access the I/O port. The I/O port controls the printer or PSG.

- ④  $\overline{\text{RFSH}}$   
Signal from Z80A(CPU).  
Used as a timing signal to refresh the dynamic RAM.
- ⑤  $\overline{\text{RD}}$  and  $\overline{\text{WR}}$   
Signal sent from Z80A (CPU).  $\overline{\text{WR}}$  causes Z80A to write data into the memory or I/O device.  $\overline{\text{RD}}$  causes Z80A to read data from the memory or I/O device.
- ⑥  $\overline{\text{WAIT}}$   
Signal causing the CPU to wait until the peripheral device completes the operation when the operation of the peripheral device is delayed from that of the CPU.  $\overline{\text{WAIT}}$  is output to Z80A (CPU).
- ⑦  $\overline{\text{ROMCS}}$   
Select signal for MSX BASIC ROM (IC49).
- ⑧  $\overline{\text{MPX}}$   
Address select signal for dynamic RAM.
- ⑨  $\overline{\text{RAS}}$   
Refresh timing signal to periodically refresh the dynamic RAM contents.
- ⑩  $\overline{\text{CAS2/E}}$  and  $\overline{\text{CAS3}}$   
 $\overline{\text{CAS}}$  for the dynamic RAM.
- ⑪  $\overline{\text{WE}}$   
Write signal for the dynamic RAM.
- ⑫  $\overline{\text{CS1}}$ ,  $\overline{\text{CS2}}$ , and  $\overline{\text{CS3}}$   
Chip select signals to read out the contents of ROM inserted into the slot (i.e., the game machine). ( $\overline{\text{CS1}}$  ranges from 4000 to 7FFF,  $\overline{\text{CS2}}$  from 8000 to BFFF, and  $\overline{\text{CS12}}$  from 4000 to BFFF.)
- ⑬  $\overline{\text{SLT1}}$ ,  $\overline{\text{SLT2}}$ , and  $\overline{\text{SLT3/30}}$   
Slot select signals. ( $\overline{\text{SLT1}}$  selects SLOT#1,  $\overline{\text{SLT2}}$  selects SLOT#2,  $\overline{\text{SLT3/30}}$  selects SLOT#3 or SLOT#30.)
- ⑭  $\overline{\text{SLOT01/31}}$   
Select signal to select extended slot#01 or #31.
- ⑮  $\overline{\text{SLT03/33}}$   
Select signal to select extended slot#03 or #33.
- ⑯  $\overline{\text{RSEL}}$   
Control signal to the extended slot select register.
- ⑰  $\overline{\text{VDPCSR}}$   
Timing signal to read data out of VDP (IC25).
- ⑱  $\overline{\text{VDPCSW}}$   
Timing signal to write data into VDP (IC25).
- ⑲ PDB0 through PDB7  
Signals to specify data to be output to the printer.
- ⑳  $\overline{\text{PSTB}}$   
The printer starts when this signal is sent.
- ㉑  $\overline{\text{BUSY}}$   
Signal input from the printer while the printer is operating.  $\overline{\text{BUSY}}$  is used to determine whether data is to be sent to the printer.
- ㉒  $\overline{\text{X0}}$  through  $\overline{\text{X7}}$   
Keyboard return signals.
- ㉓  $\overline{\text{Y0}}$  through  $\overline{\text{Y9}}$  ( $\overline{\text{Y10/SK}}$ )  
Keyboard scan signal output.  $\overline{\text{Y10/SK}}$  which is used as a serial input signal becomes valid in accordance with the reset function being selected.
- ㉔ FWD1 and FWD2  
Joystick FWD signal or general-purpose port signal input.
- ㉕ BACK1 and BACK2  
Joystick BACK signal or general-purpose port signal input.
- ㉖ LEFT1 and LEFT2  
Joystick LEFT signal or general-purpose port signal input.
- ㉗ RIGHT1 and RIGHT2  
Joystick RIGHT signal or general-purpose port signal input.
- ㉘ TRGA1 and TRGA2  
Joystick TRGA signal or general-purpose port signal output.
- ㉙ TRGB1 and TRGB2  
Joystick TRGB signal or general-purpose port signal output.
- ㉚ STB1 and STB2  
General-purpose port signal output.
- ㉛ CMI  
Data input from the cassette tape.
- ㉜ CMO  
Data recorded into the cassette tape.
- ㉝  $\overline{\text{CS}}$   
Control signal to the REM cassette.

- ③④ CAPS  
CAPS lamp signal output to the keyboard (to drive the LED).
- ③⑤ KANA  
Kana lamp signal output to the keyboard (to drive the LED).
- ③⑥ JIS/50  
Keyboard arrangement control signal input.
- ③⑦ RSTI  
Initial value setting signal (input to the Schmitt trigger).
- ③⑧ RSTO  
Initial value setting signal (output from the Schmitt trigger).
- ③⑨ PPISND  
Sound signal being output by software.
- ④① SSGND  
Analog sound signal being output by SSG.
- ④②  $\emptyset$  IN  
Clock input signal. (Devices other than Z80A use the  $\emptyset$  IN signal as a clock.)
- ④③  $\emptyset$  OUT  
Clock signal output to Z80A (CPU).

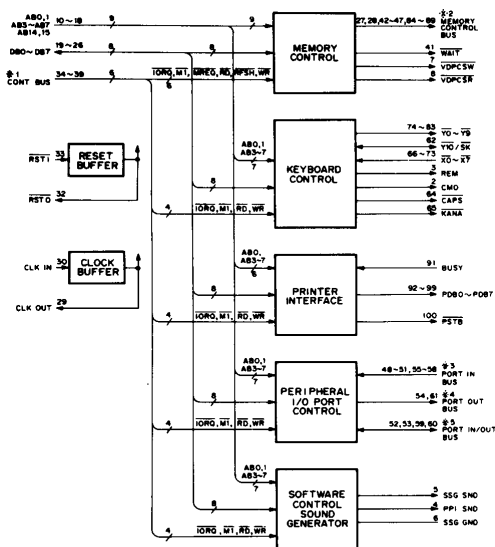

### 3-3-2. Functions

When Z80 (CPU) enters the M1 cycle,  $\overline{M1}$  goes low in the T1 state. This signal is input to the S-3527 M1 terminal, then both Z80A and S-3527 start operating in the M1 mode.

- ① When S-3527 enters the M1 cycle.
- ②  $\overline{RAS}$  and  $\overline{MPX}$  remain low in the T1 state in the timing between the first and second clocks, then the row address is accessed by changing the dynamic memory address bus.
- ③  $\overline{MREQ}$  and  $\overline{RD}$  for Z80A (CPU) go low in the T1 state and are sent to S-3527.  $\overline{CASn}$ ,  $\overline{CS}$ ,  $\overline{ROMCS}$ , and/or  $\overline{SLT}$  are sent, responding to  $\overline{MREQ}$  and  $\overline{RD}$ , by using the slot specification register within S-3527. These are used to access the memory, and the operation code is fetched from the memory and loaded into the CPU instruction register.
- ④ When  $\overline{WAIT}$  which is sent from S-3527 to Z80A remains high in the T2 state, Z80A enters the T3 state. When  $\overline{WAIT}$  remains low, Z80A enters the wait ( $T_w$ ) state and remains in this state until  $\overline{WAIT}$  goes high.
- ⑤ Z80A outputs the refresh register contents to the address bus in the T3 state.  $\overline{RFSH}$  then goes low and is sent to S-3527.
- ⑥  $\overline{MREQ}$  which is output from Z80A changes the state from low to high in the T4 state. The dynamic RAM contents can be refreshed by the address bus on the address bus while  $\overline{MREQ}$  remains high with  $\overline{RFSH}$  low.

The operation code is fetched from the memory in the T4 state on the M1 cycle timing diagram. ⑩ indicates the T1 state in succeeding cycles. The refresh address is output on the address bus, and this state is indicated by  $\overline{RFSH}$  remaining low. When the refresh address on the address bus is stopped,  $\overline{RFSH}$  goes from low to high.

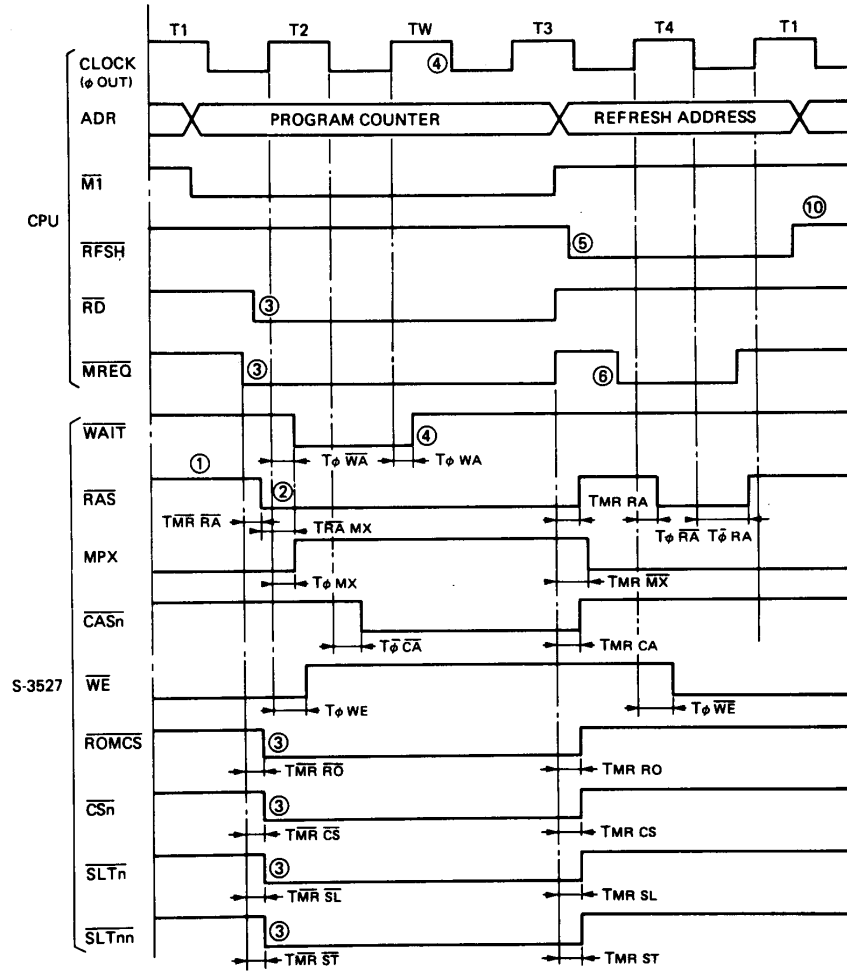

S-3527 block diagram

\*1 CONT BUS; IORQ, MT, MREQ, RD, RFSH, WR  
 \*2 MEMORY CONTROL BUS; CAS2/E, CAS3, CST1, CST2, MPX, RAS, ROMCS, SLT1, SLT2, SLT01/31, SLOY03/33, SLY3/3D

### 3-4. Slot Extension Circuit

RSEL (input to pin 9 of S-3527 (IC18)) is used to extend the slots. Any address input signals other than those specified by S-3527 (i.e., BA2, and BA8 through BA13) are NAND'ed together to generate RSEL.

Address FFFFH is decoded by using RSEL, and the S-3527 extension slot register can be used when address FFFFH is decoded.

When the S-3527 extension slot register is used, the use of the main RAM is inhibited by BA15. BA15 is input to IC43 (NAND gate) to generate RSEL which decodes data at address FFFFH.

If X6 (pin 72 of S-3527) goes low during the power-on sequence, slot 0 is extended.

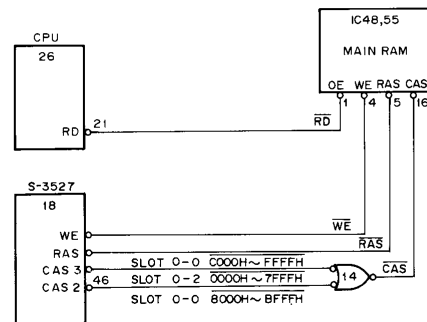

### 3-5. MAIN RAM

The main RAM has a map which consists of pages 2 and 3 (addresses 8000H through FFFFH) of extended slot 0-0 and pages 0 and 1 (addresses 0000H through 7FFFH) of extended slot 0-2.

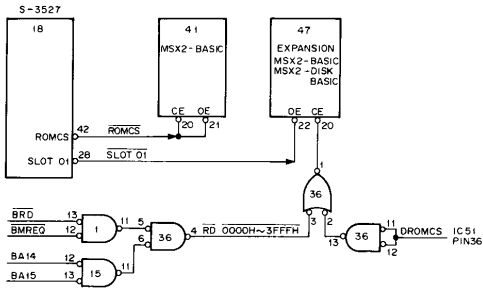

The column address latch signal ( $\overline{\text{CAS}}$ ) is generated by passing  $\overline{\text{CAS2}}$  and  $\overline{\text{CAS3}}$  of S-3527 through NAND gate IC14.

$\overline{\text{CAS2}}$  is generated when one of addresses 0000H through 7FFFH on slot 0-2 is accessed, or when one of addresses 8000H through BFFFH on slot 0-0 is accessed.  $\overline{\text{CAS3}}$  is generated when one of addresses C000H through FFFFH on slot 0-0 is accessed.

$\overline{\text{WE}}$  is used to write data into RAM.  $\overline{\text{RAS}}$  is used to latch the row address.  $\overline{\text{RD}}$  is used to enable data to be output.

### 3-6. ROM SELECTOR for MSX-2 BASIC

- ① ROM IC41 for MSX-2 BASIC is selected by  $\overline{\text{ROMCS}}$  at pin 42 of S-3527 (IC-18). When the CPU reads data at addresses 0000H through 7FFFH on slot0,  $\overline{\text{ROMCS}}$  goes low.
- ② Extended MSX-2 BASIC is stored at addresses 0000H through 3FFFH in IC47, and MSX-2 disk BASIC is stored at 4000H through 7FF7H in IC47.  
RD is generated at one of 0000H through 3FFFH by BRD, BMREQ, BA14, and BA15 of IC36, and is input to pin 3 of IC36 to select IC47.

$\overline{\text{SLOTO1}}$  at pin 29 of S-3527, which is an extended slot select signal, is input to the  $\overline{\text{OE}}$  terminal of IC47 to read data out of ROM.  $\overline{\text{DROMCS}}$  at pins 11 and 12 of IC36, which is an ROM select signal for MSX-2 disk BASIC, is output from IC50 (CXD1032Q).

### 3-7. FDD CIRCUIT

#### 3-7-1. Memory Map

The FD interface is assigned to addresses 4000H through 7FFFH on the memory map.

#### 3-7-2. Floppy Disk, Interface, and Control LSI (CXD1032Q)

The address decoder, timer, clock oscillator, and selector are implemented on one chip. CXD-1032Q (49 pins) has the following configurations:

CXD-1032Q pin assignment

CXD1032Q pin functions

- ① AB0 through AB15 (Address buses)  
Bus line for the address signal to read data out of the memory or to write data into the memory, or to perform the input/output operations.
- ② D0 through D2, D6, and D7 (Data buses)  
Bus line for data to be input to or to be output from the device.
- ③  $\overline{\text{BWR}}$   
Write signal input. This signal is gated together with  $\overline{\text{SLTSL}}$ , and the resultant signal ( $\overline{\text{WE}}$ ) is fed to the floppy disk controller (FDC).
- ④  $\overline{\text{BRD}}$   
Read signal input. This signal is gated together with  $\overline{\text{SLTSL}}$ , and the resultant signal ( $\overline{\text{RE}}$ ) is fed to the floppy disk controller (FDC).
- ⑤  $\overline{\text{SLTSL}}$   
Slot select signal input.
- ⑥ TEST  
Test signal input. Normally, set to low.
- ⑦ SIDE IN  
Specifies either the single or double side of the disk. When low, this signal specifies the single side.
- ⑧ DRIVE 0  
Drive 0 select signal output.
- ⑨ DRQ IN  
Data request input.  
When data is read from the disk by floppy disk controller (FDC) while this signal is being specified, data is loaded into the register. When data is written into the disk by floppy disk controller (FDC) while this signal is being specified, a check is made to whether the register is empty, and the FDD motor is controlled if the register is empty.
- ⑩ IRQ IN  
FDC command end signal input.
- ⑪ MON  
FDC motor on/off control signal.
- ⑫ DRIVE 1  
Drive 1 select signal output.
- ⑬ 1MH CLOCK  
1MHz clock signal output. This signal is fed to the CLK input terminal of the floppy disk controller (FDC).
- ⑭  $\overline{\text{RE}}$   
Data control signal to output data which has been written into the register of the floppy disk controller by specifying  $\overline{\text{WE}}$ .
- ⑮  $\overline{\text{WE}}$   
Data control signal to write data into the register from the DAL of the floppy disk controller.
- ⑯  $\overline{\text{CS}}$   
Chip select signal for the floppy disk controller (FDC). When CS is specified, data can be transferred to or from the floppy disk controller (FDC).
- ⑰  $\overline{\text{ROMCS}}$   
Disk ROM select signal.

### 3-7-3. ROM Select Signal for MSX-2 Disk BASIC

SLOT01 is fed from pin 28 of S-3527 IC18 to pin 14 (SLTSL terminal) of IC50. When the CPU accesses one of addresses 4000H through 7FF7H, DROMCS is output from pin 36 of CAD-1032Q CI50, and this signal is then input to pins 11 and 12 of IC36 to select MSX-2 disk BASIC. S $\overline{\text{LOT}}01$  is also fed to pin 22 ( $\overline{\text{OE}}$  terminal) of IC47 to read data from ROM.

The select signal at pin 13 of IC36 is used to select the extended MSX-2 BASIC for IC47.

### 3-7-4. FDC

Memory map contents

Port address	Hardware into which data is written by CPU	Hardware from which data is read by CPU
7FF8H	Command register	Status register
7FF9H	Track register	Track register
7FFAH	Selector register	Selector register
7FFBH	Data register	Data register
7FFCH	Side selection	Side selection
7FFDH	Drive selection	Drive selection
7FFFH		IRQ/DRQ status

#### ① FDC select

Each register in the floppy disk controller (IC56) is assigned to one of addresses 7FF8H through 7FFBH.

When address signals A0 and A1 and FDCCS at pin 35 of IC50 ( $\overline{\text{CS}}$  terminal) are input to the  $\overline{\text{CS}}$  terminal (pin 3) of IC56, the corresponding register is selected.

F $\overline{\text{DCCS}}$  is output when one of addresses 7FF8H through 7FFBH is accessed.

CR ; COMMAND REGISTER  
 DR ; DATA REGISTER  
 DSR; DATA SHIFT REGISTER  
 SCR; SECTOR REGISTER  
 TR ; TRACK REGISTER  
 STR; STATUS REGISTER

Register selection

CS	A1	A0	RE = 0	WE = 0
1	X	X	NON SELECT	DAL=HI-Z
0	0	0	STR	CR
0	0	1	TR	TR
0	1	0	SCR	SCR
0	1	1	DR	DR

0 ; LOW LEVEL  
 1 ; HIGH LEVEL  
 X ; DON'T CARE  
 HI-Z; HIGH IMPEDANCE

#### ② FDC register operations

- Command register (CR)  
 8-bit write register. The command which corresponds to WD2793-02 is written into the processor. When the execution of any command other than the WD2793-02 command is completed, the command write operation starts.
- Status register (STR)  
 8-bit read register. This register indicates the internal status of WD2793-02, the processing status of command execution, and the disk drive status. The bit functions vary depending on whether the command is being executed or the command has been executed.
- Data register (DR)  
 Read/Write register. Data read from the disk is loaded into DR; data which has been written into DR is written into the disk. The designated track address is written into DR during seek operation.

• **Track register (TR)**  
 8-bit read/write register. FFH is loaded into TR when the master reset signal (MR) changes from low to high and vice versa. When TR00 goes low, the contents of TR becomes 00H. The track number where the head is located is normally stored in this register. For some types of commands in WD2793-02, the contents of this register can be updated. If a read data command or a write data command is specified, the contents of this register are compared with the ID field track number which has been read out of the disk. If they coincide, a read or write operation can be performed.

• **Selector register (SCR)**  
 8-bit read/write register. If a read data command or a write data command is specified, the contents of this register are compared with the ID field track number which has been read out of the disk. If they coincide, a read or write operation can be performed.

When a read address command is specified, the ID field track number is stored.

**3-7-5. Side Selection**

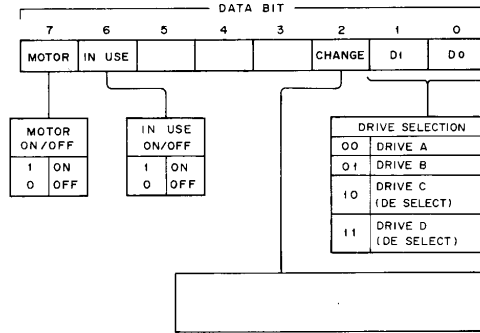

When SIDE is specified as 0, side 0 is selected. When SIDE is specified as 1, side 1 is selected.

If address bus signal 7FFCH is specified when  $\overline{\text{SLTSL}}$  at pin 14 of IC50 is low, D0 at pin 41 of IC50 and SIDE IN at pin 17 of IC50 are ANDed together to generate a SIDE SELECT signal. If address bus signal 7FFCH is specified when both  $\overline{\text{SLTSL}}$  and  $\overline{\text{RD}}$  are low, the inverted D0 signal becomes a SIDE SELECT signal and appears at pin 21 of IC50.

When SIDE SELECT is low, SIDE 1 (upper) is selected. When SIDE SELECT is high, SIDE 0 (lower) is selected.

If SIDE IN at pin 17 of IC50 is high and unchanged, both sides are indicated.

**3-7-6. Drive Selection**

**3-7-7. IRQ/DRQ Status**

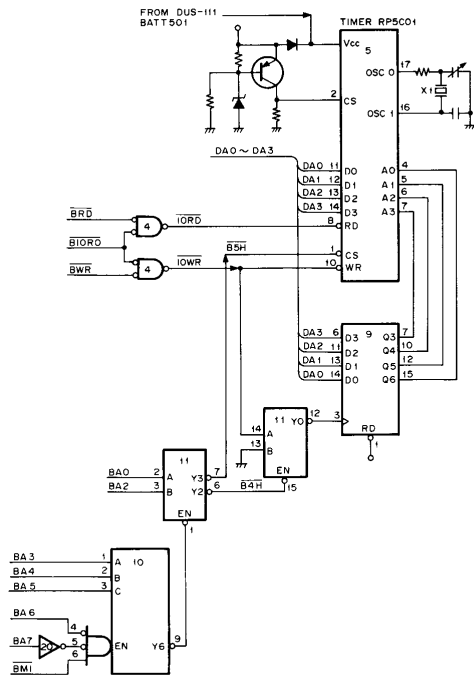

When command execution is completed or aborts, IRQ goes low.

When a data write/read operation is requested, DRQ goes low.

### 3-8. TIMER CIRCUIT

This unit has an internal 24-hour timer which is backed up by a built-in Ni-Cd battery.

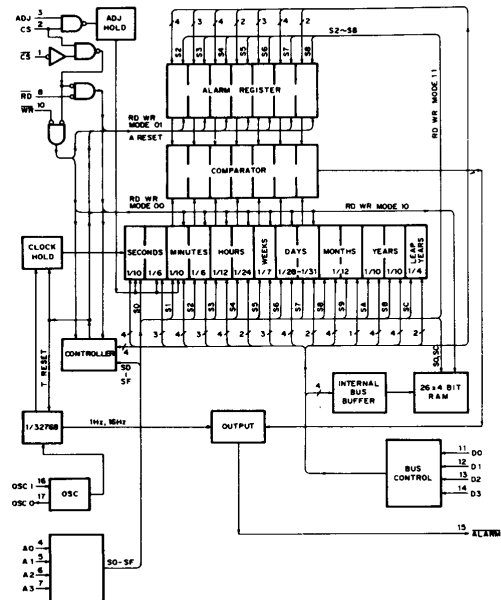

Addresses BA0 and BA2 are fed to the address decoder input terminals (2 and 3) of IC11 (1/2). Combination of BA0 and BA2 selects ports B4H and B5H of MSX timer.

The MSX timer port operations are as follows:

- B4H . . . . . Address set
- B5H . . . . . Data transfer

These become valid only when  $\overline{\text{BIORQ}}$  and  $\overline{\text{BRD}}$ , or  $\overline{\text{BIORQ}}$  and BWR are output together.

The block diagram of the timer IC (IC5) is shown below.

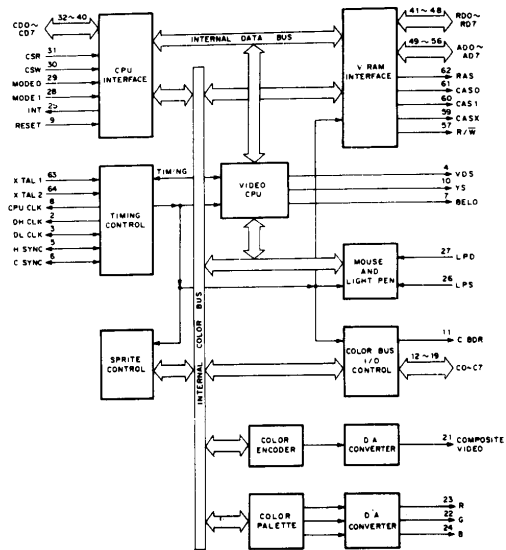

### 3-9. V9938 (MSX-VIDEO/VDP)

The VDP of this unit contains V99387 which has been developed for MSX-2. VDP is software-compatible with the MSX-1 VDP (TMS9918A or TMS9918A), and is assigned to 98H and 99H of the I/O port.

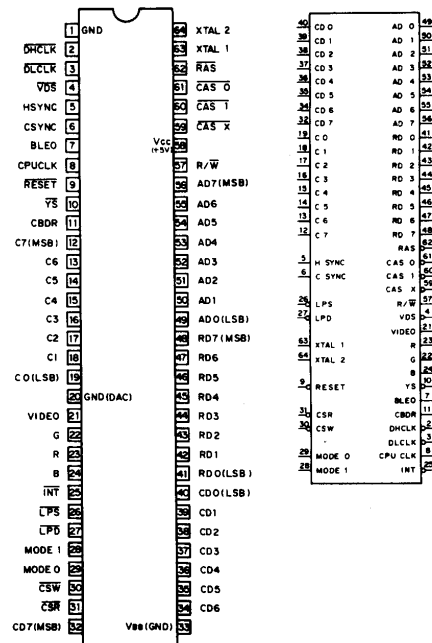

#### 3-9-1. Main Features

- Single 5V power supply
- The linear RGB signals and composite video signals are output.
- The NTSC encoder of this unit generates the composite video output signal from the RGB signals, but this unit does not use the composite signal which can be generated by IC.
- Up to 512 colors can be displayed by using the built-in color pallet.
- Up to 512 x 424 pixels can be displayed in 16 colors.
- Bit map graphics is possible.
- Up to 256 colors can be displayed concurrently.
- A display memory area of 16K bytes to 128K bytes can be used.
- DRAMs of 16K one-bit words, 16K 4-bit word, 64K one-bit words, and 64K 4-bit words can be used.
- The automatic refresh function for DRAMs has 256 addresses and can be performed in 4msec.
- The extended VRAM can be connected to the system.
- The mouse and light pen interfaces are built in.
- Up to eight sprites can be displayed in each line.
- The colors of the respective sprites can be specified in horizontal line units.
- This unit provides the Area Move, Line, and Search commands.
- This unit performs logical operations.
- The address can be specified in coordinates.
- External synchronization is possible.
- Superimposing can be done.
- Data can be digitized.
- A multiple MSX video signal can be generated.
- The extended color pallets can be installed externally by using the color bus output.

#### IC block diagram

#### 3-9-2. Terminals

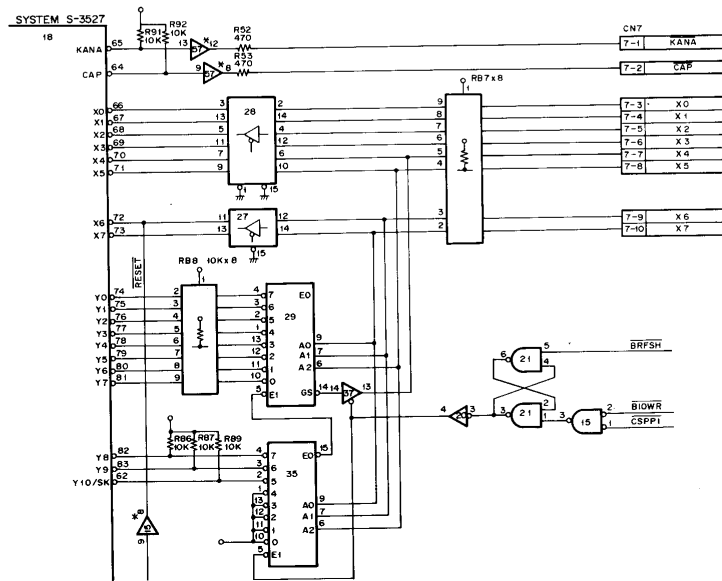

- ① CD0 through CD7  
Data bus for CPU.
- ② RD0 through RD7  
Data bus for VRAM.
- ③ AD0 through AD7  
Data bus for VRAM.
- ④ C0 through C7  
Color bus.  
Normally used to output a color code. Used as an input port during digitizing. When a mouse is used, the high-order half byte is used for the mouse.  
C4 = XA  
C5 = XB  
C6 = YA  
C7 = YB
- ⑤ MODE0  
CPU interface mode select 0.
- ⑥ MODE 1  
CPU interface mode select 1.
- ⑦  $\overline{\text{CSR}}$   
CPU-Read Strobe.
- ⑧  $\overline{\text{CSW}}$   
CPW-Write Strobe.
- ⑨  $\overline{\text{RAS}}$   
VRAS Row Address Strobe.
- ⑩  $\overline{\text{CAS0}}$   
VRAM column address strobe 0 (in the first half of the VRAM addresses).
- ⑪  $\overline{\text{CAS1}}$   
VRAM column address strobe 1 (in the second half of the VRAM addresses).
- ⑫  $\overline{\text{CASX}}$   
VRAM column address strobe X (for the extended VRAM).
- ⑬  $\text{R}/\overline{\text{W}}$   
VRAM data select.  
Low: Access VRAM for displaying data  
High: Access VRAM for any other purposes
- ⑭ VIDEO  
NTSC composite video signal output.
- ⑮ R, G, and B  
Linear RGB signal output.
- ⑯  $\overline{\text{YS}}$   
Selects either the MSX video RGB output signal or the external video signal (this signal is valid for superimposing).
- High: Indicates that the MSX video output signal is transparent.  
Low: Indicates that the MSX video output signal is not transparent.
- ⑰ BLE0  
Tri-state signal output. When HSYNC goes from high to middle, it is output. When HSYNC goes from middle to low, it is input.  
High: Any timing other than HSYNC, or color burst timing.  
Middle: Any timing other than HSYNC and the color burst.  
Low: HSYNC input
- ⑱ HSYNC  
Tri-state signal. When HSYNC goes from high to middle, it is output. When HSYNC goes from middle to low, it is input.  
High: Any timing other than HSYNC, or color burst timing.  
Middle: Any timing other than HSYNC and the color burst.  
Low: HSYNC input.
- ⑲ CSYNC  
Tri-state signal. When CSYNC is high, the composite SYNC signal is output. When CSYNC is low, the VSYNC signal is input.
- ⑳ CBDR  
Indicates the direction in which the signal travels on the color bus.  
High: Data is input to the color bus  
Low: Data is output from the color bus
- ㉑  $\overline{\text{LPS}}$   
Light pen switch input. When a mouse is used, the mouse switch is set to on or off corresponding to the state of this signal.  
Low: SW on  
High: SW off
- ㉒  $\overline{\text{LPD}}$   
Indicates that the light signal is detected in the light pen. When a mouse is used, the mouse switch is set to on or off corresponding to the state of this signal.  
Low: Indicates that the light has been detected or that the switch is set to on.  
High: Indicates any state other than the above.

- ②③ DHCLK  
Dot clock signal output at approximately 10.7MHz for high resolution. Open drain signal output.
- ②④ DLCLK  
Dot clock signal output at approximately 5.4MHz for high resolution. Open drain signal output.  
This signal can be input from the mode register, and it can be used for the MSX video signal.
- ②⑤ XTAL 1/2  
Connected to the crystal oscillator. When an external clock is used, it should be fed to the unit through this pin.
- ②⑥ CPUCLK  
Outputs one sixth of the crystal oscillator frequency.
- ②⑦ INT  
CPU interrupt output. Open drain output.  
Low: Indicates that an interrupt has occurred.
- ②⑧ RESET  
Indicates that the circuits within the MSX video system are initialized.

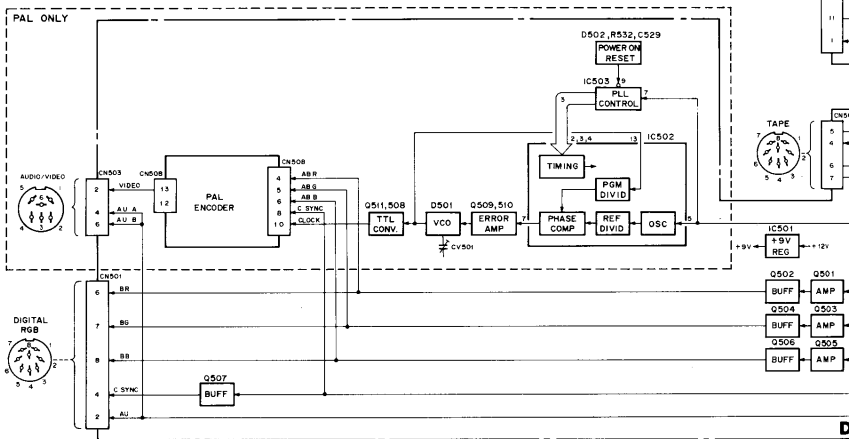

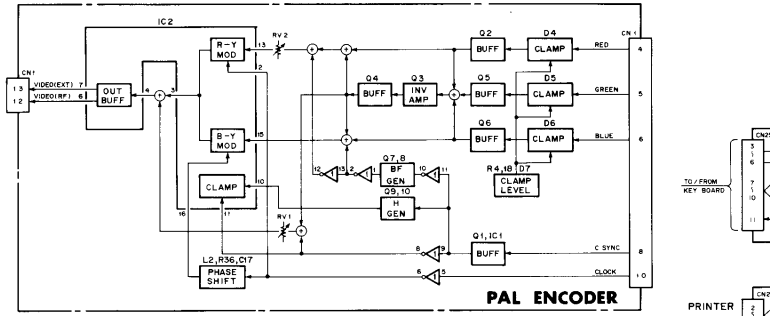

### 3-10. KEYBOARD ENCODER

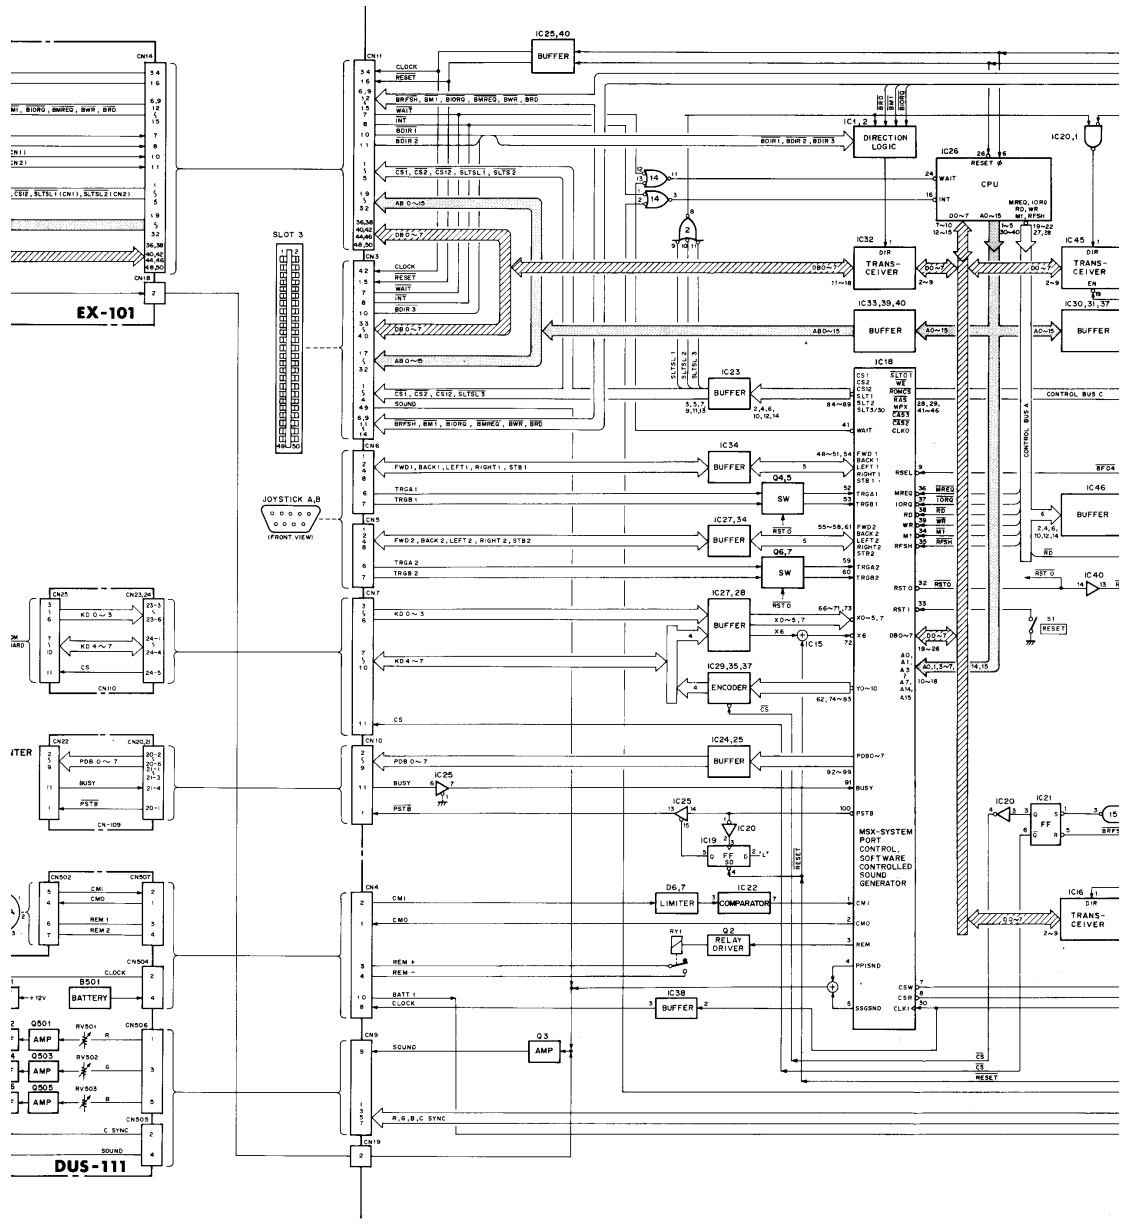

This machine provides separate keyboards and thus data is multiplexed because of the limited number (13 lines) of lines within a cable. Y0 through Y10 are sent from IC18 (S-3527) to the priority encoder consisting of IC29 and IC35, and then converted into a 4-bit signal. These are multiplexed with X4 through X7 of the return signal, and the sent out while data is written into PPI of IC18 (S-3527).

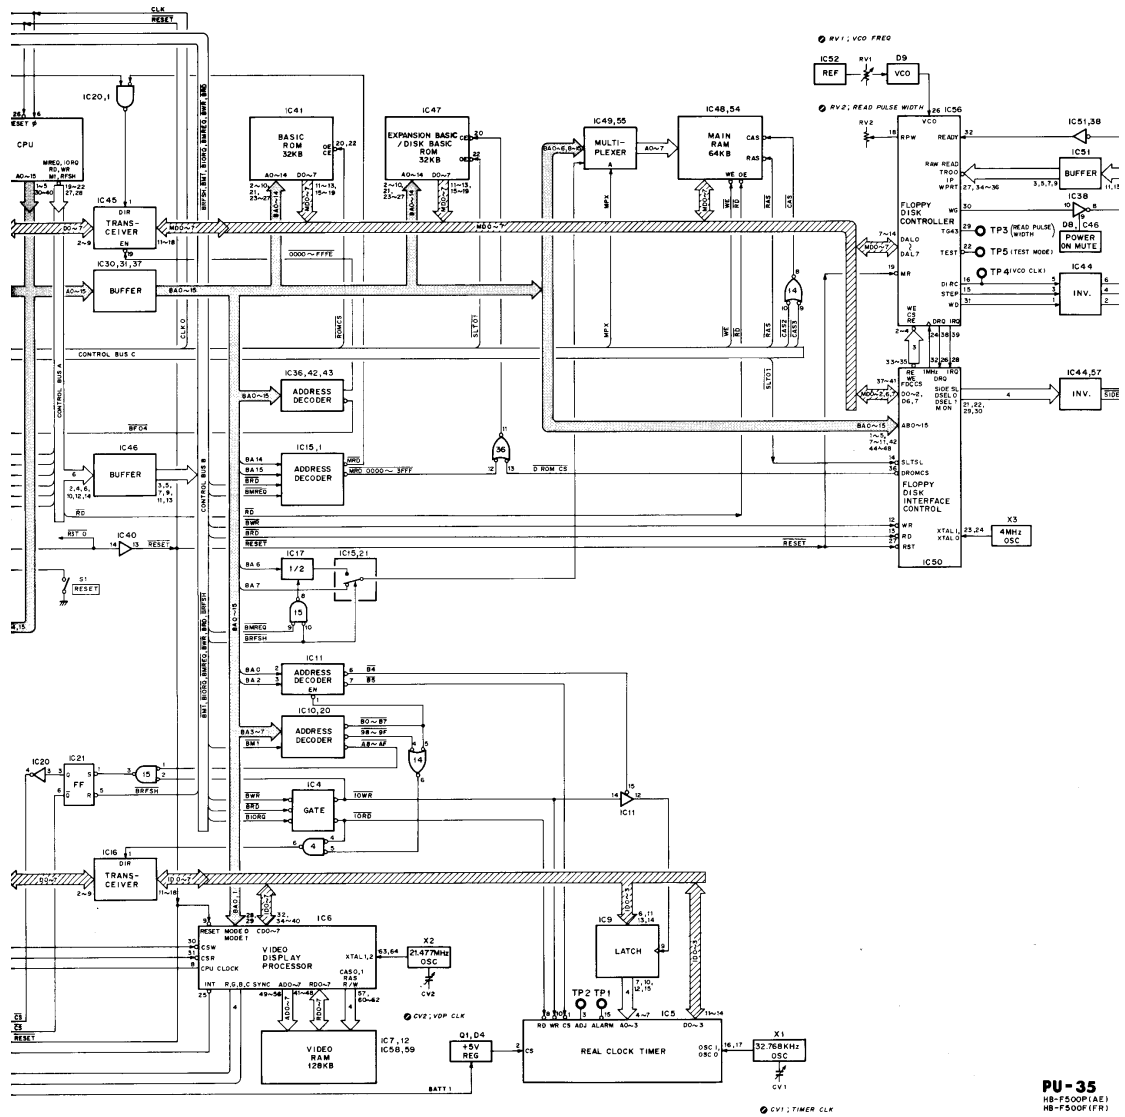

Data is first written into PPI of IC18 (S-3527) by using the CPU, then latched into latch IC21 on the keyboard by the refresh signal while an instruction is being fetched from the memory immediately after the write operation. When latched, data cannot be sent out.

220 GOTO 80
230 SCREEN 1:COLOR 15,4,7:'MENU
240 OUT &HB5,12:'Timer Clock adj.(reset)
250 GOTO 80

```

#### 6-1-2. Use of Adjusting Program Example

When the program is run, the MENU display appears on the screen.

1. Press the W key.  
The whole screen display turns white.  
Used for the RGB level adjustment.
2. Press the S key.  
Used for the timer block adjustment.  
A 16Hz frequency appears at IC11 through IC15.
3. Press the R key.  
Cancels the timer clock adjustment.

#### 6-1-3. Connection

- . Connect the KX-14CP1 RGB monitor to RGB connector CN501 or terminate the RGB output terminals (pins 6, 7, and 8) of CN501 in 75 ohms.

### 6-2. CPU CLOCK FREQUENCY ADJUSTMENT

Equipment Required: Frequency counter  
Condition: Power ON  
Check Point: IC26, pin 6/PU-35 board  
Specification: 3.578281Hz  $\pm$ 5Hz  
Adjustment: CV/PU-35 board

### 6-3. TIMER CLOCK FREQUENCY ADJUSTMENT

Connection: Connect 100k-ohm pull-up resistors between IC5 and +5V dc.  
Equipment Required: Frequency counter  
Condition: . Run the adjusting program and press the S key.  
. After adjustment is completed, press the R key.  
Check Point: IC11, pin 15/PU-35 board  
Specification: 15.9999Hz - 16.0001Hz  
Adjustment: CV1/PU-35 board

### 6-4. RGB OUTPUT LEVEL ADJUSTMENT

#### 6-4-1. R Level Adjustment

Equipment Required: Oscilloscope  
Condition: . Run the adjusting program and press the W key.  
. After adjustment is completed, press the R key.  
Check Point: CN501, pin 6/DUS-111 board  
Specification: A=0.7V  $\pm$  0.02V

Adjustment: RV501/DUS-111 board

#### 6-4-2. B Level Adjustment

Equipment Required: Oscilloscope  
Condition: . Run the adjusting program and press the W key.  
. After adjustment is completed, press the R key.  
Check Point: CN501, pin 8/DUS-111 board  
Specification:  $A=0.7V \pm 0.02V$

Adjustment: RV502/DUS-111 board

#### 6-4-3. G Level Adjustment

Equipment Required: Oscilloscope  
Condition: . Run the adjusting program and press the W key.  
. After adjustment is completed, press the R key.  
Check Point: CN501, pin 7/DUS-111 board  
Specification:  $A=0.7V \pm 0.02V$

Adjustment: RV502/DUS-111 board

#### 6-5. PDC ADJUSTMENT

##### 6-5-1. VCO Frequency Adjustment

Equipment Required: Frequency counter  
Condition: Three minutes after the power is turned on, connect TP5 to ground using a jumper wire.  
Check Point: TP4/PU-35 board

Specification:  $250kHz \pm 1kHz$

Adjustment: RV1/PU-35 board

Note: After adjustment is completed, remove the jumper wire.

##### 6-5-2. Read Pulse Width Adjustment

Equipment Required: Oscilloscope  
Condition: Three minutes after the power is turned on, connect TP5 to ground using a jumper wire.  
Check Point: TP3/PU-35 board

Specification:  $T=0.5\mu sec \pm 10nsec$

Adjustment: RV2/PU-35 board

Note: After adjustment is completed, remove the jumper wire.

## CHAPTER 7

### REPAIR PARTS AND FIXTURE

## COVER BLOCK

### NOTE:

1. **The shaded and  $\Delta$ -marked components are critical to safety. Replace only with same components as specified.**
2. Parts printed in Bold-Face type are normally stocked for replacement purposes. The remaining parts shown in this manual are not normally required for routine service work. Orders for parts not shown in Bold-Face type will be processed, but allow for additional delivery time.
3. Item with no part number and/or no description are not stocked because they are seldom required for routine service.

7-1-2. Chassis Block

NOTE:

- The shaded and ▲-marked components are critical to safety. Replace only with same components as specified.
- Parts printed in **Bold-Face type** are normally stocked for replacement purposes. The remaining parts shown in this manual are not normally required for routine service work. Orders for parts not shown in **Bold-Face type** will be processed, but allow for additional delivery time.
